

100 mm - measure me

payload "TAG7" 36h11 id 7 (8 x 8 cells)
marker_size = 0.1900 m (190.0 mm black area, edge to edge) module = 23.75 mm

Mount FLAT on rigid backing - a rippled sheet corrupts the depth plane fit.

QUIET ZONE - the one that decides whether this works at all:
this sheet gives 0.4 of the 1 cells the spec wants. Mount on WHITE
backing reaching ≥ 14 mm beyond every edge of this sheet
(238 mm square of white overall). On a dark surround, decoding
fails at any distance.

Print at 100% / actual size; check the bar. A wrong scale costs only
proportional PnP range and decode range - nothing else.

Estimated decode range (zbar, ~2 px per module):

1280x720 (fx 612): 7.3 m
1920x1080 (fx 918): 10.9 m
