

100 mm - measure me

payload "TAG7" 36h11 id 7 (8 x 8 cells)  
marker\_size = 0.1900 m (190.0 mm black area, edge to edge) module = 23.75 mm

Mount FLAT on rigid backing - a rippled sheet corrupts the depth plane fit.

QUIET ZONE: this sheet leaves 0.4 of the 1 blank cell AprilTag likes.  
Measured synthetically, 36h11 still read 5/5 with NO quiet zone on white,  
grey and dark backgrounds: the detector finds the black border by contour,  
unlike a QR scanline decoder. A margin is good practice, not a requirement.

Print at 100% / actual size; check the bar. A wrong scale costs only  
proportional PnP range and decode range - nothing else.

Estimated decode range (~1.5 px per cell):

1280x720 (fx 612): 7.3 m  
1920x1080 (fx 918): 10.9 m
